

## **Sprint Velocity: 80%**

### **What Went Well:**

The team is close to finishing everything up. They successfully implemented Filtration, Pagination, and Registration in steps, along with review details in registration, display profile, edit profile, auth guards, routings, and other UI/UX enhancements. Despite connectivity issues faced by our tech lead, we managed to complete these tasks and enhance the project's presentation for the upcoming defense.

### **What Needs to Be Done:**

In the upcoming sprint, our focus will be on implementing the key features, "Reserved" (*previously "Make an Offer"*) and the rating system. We will also address minor issues in the system and work on important improvements and additional features.

### **Areas for Improvement:**

Our team is performing well. Once the final features are implemented, we will conduct Sanity/Smoke testing in the UAT environment before deploying to production. This will ensure quality assurance before the mock defense.
